5. Limitations and criticism of Schema.org
6. Conclusion
7. Sources

# 1 Motivation and history

- End of 2010s: **Augmentation of search** with structured data
- First focus on 10 verticals (e. g. recipes, events)
- Led to a **proliferation of formats** across search engines and prevented scaling
- In 2011 **joint initiative** by Bing, Google, and Yahoo (and later Yandex)
- **Goal:** *Single* schema across all topics; *single* vocabulary for webmasters
- **Result:** Schema.org

## 2 Basic information and usage

- Schema.org is a **vocabulary**, not an ontology
- Designed for **annotation of webpage content**
- Enables rich markup of search results
- Also used in emails, e. g. for reservations in restaurants
- Used by **embedding** Microdata or JSON-LD code in **HTML**
- JSON-LD syntax more popular
- In 2022 **38 % of PLDs** used Schema.org annotations
- Up from 3 % in 2013

## 3 Structure of Schema.org

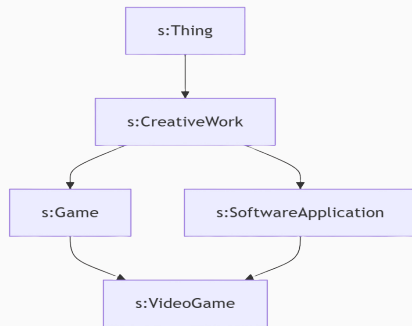

### 3.1 Items and (data) types

- **Items** are things in the **real world**, we wish to describe
- Three hierarchies of types (classes)
  - s:Thing and its subtypes; e. g. s:Event
  - s:DataType and its subtypes; e. g. s>Date
  - s:Enumeration and its subtypes; e. g. s:DayOfWeek
- Types **inherit properties** from one or multiple supertypes
- 811 types, 14 data types, 89 enumerations, 495 enum members

## 3 Structure of Schema.org

### 3.2 Structure of the *s:Thing*-hierarchy

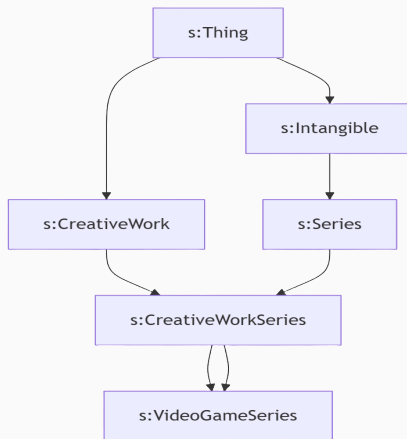

Not a tree structure!

**Figure 1:** Hierarchy of *s:VideoGame*

## 3 Structure of Schema.org

### 3.2 Structure of the *s:Thing*-hierarchy (cont.)

**Figure 2:** Hierarchy of *s:VideoGameSeries*

## 3 Structure of Schema.org

### 3.3 Properties

- Container for the attributes of an item
- Link two types:
  1. Type and data type
  2. Type and another type
- Have domain and range definitions
- 1484 properties

## 3 Structure of Schema.org

### 3.4 Domain and range of properties

- **Domain:** Types the property can be used on
- **Range:** Expected types of property values
- Subtypes can **extend range**
- Domain and range are **disjunctive**

## 3 Structure of Schema.org

### 3.5 Example of the properties of a type

- s:FoodEstablishmentReservation
- s:Thing > s:Intangible > s:Reservation > s:FoodEstablishmentReservation
- Properties:
  - s:startTime | range: *s:Time* or *s:DateTime* | from s:FoodEstablishmentReservation
  - s:underName | range: s:Person or s:Organization | from s:Reservation
  - s:name | range: *s:Text* | from s:Thing
  - ... many more... (in total  $27 = 12 + 12 + 3$ )

## 4 Real-world examples

### 4.1 Schema.org in emails

Extract from the HTML embedded in the confirmation email

```
{
  "@context": "http://schema.org",
  "@type": "FoodEstablishmentReservation",
  "reservationNumber": "61352",
  "reservationStatus": "http://schema.org/ReservationConfirmed",
  "underName": {
    "@type": "Person",
    "name": "Ole Julius Berg"
  },
  "reservationFor": {
    "@type": "FoodEstablishment",
    "name": "Ahoi Steffen Henssler Köln",
    "address": {
      "@type": "PostalAddress",
      "streetAddress": "Butzweilerstraße 35-39",
      "addressLocality": "Köln",
      "addressRegion": "NW",
      "postalCode": "50829",
      "addressCountry": "Deutschland"
    }
  },
  "startTime": "2024-08-30T18:15:00+02:00",
  "partySize": "2",
  "modifiedTime": "2024-08-28T19:09:33Z",
  "modifyReservationUrl": "...",
  "cancelReservationUrl": "...",
  "url": "..."
}
```

## 5 Limitations and criticism

- **Explicit** design for **webpage content**
- **Limited transferability** to other domains
- Addressed by hosted and external **extensions**
- Adoption has **plateaued**
- Some criticism of missing local ranges

## 6 Conclusion

Thank you for attending my presentation!

Do you think that Schema.org still has **unused potential**? Or are the extensions all we can expect?
